

TOBACCO

Final 2003 estimates of **broadleaf tobacco** production placed total marketed output in the Connecticut River Valley at 3.4 million pounds, 16 percent below the previous year's output due to untimely rains and lack of sunshine. Excessive moisture promoted blue mold, brown spot and increased fertilizer leaching, and farmers were forced to harrow under an estimated 13 percent of planted acreage. Additional problems appeared when the crop hung to cure; namely, pole sweat, stem rot, brown spot and sunburn not evident when initially harvested. Broadleaf yields averaged 1,429 pounds per acre in the two States, compared with 1,828 pounds per acre in 2002. Prices ranged from as low as \$0.10 per pound to over \$6.00 per pound depending on quality. The average price of \$3.58 per pound reflects an average across

all prices, weighted by pounds sold at each price. The value of 2003 crop broadleaf tobacco marketed was placed at \$12.1 million, compared with \$21.6 million a year earlier.

In 2003, producers harvested 1.3 million pounds of **shade tobacco** in Connecticut and Massachusetts, 15 percent above 2002's disease-reduced output. Yields averaged 1,253 pounds per acre, 52 more pounds per acre than in 2002, but well under the previous five-year average of 1,466 pounds per acre.

[Tobacco charts appear on page 51.]
